

# THE JAB

May 7, 2021

## What it is

It is not a vaccine: a vaccine is a de-activated infectious agent that triggers the body's natural immune response.

It is not a passive agent: this shot contains active cellular components (mRNA) that take over some of the body's natural processes for protein production. It also contains other materials that have unknown effects on the body, like nanoparticles and chemical carriers, that can trigger unpredictable immune responses.

The shot is an experimental gene therapy. These "vaccines" were approved without any published animal studies and without any long-term human studies. This means that the individuals who get them are the guinea pigs.

The clinical trials will be completed in 2023, there are 12 vaccine companies ramping up their marketing.  
Critical information for women on post-vaccination reproductive symptoms is emerging.

## How it works

The intended purpose of this shot is to trigger an immune response in the body. This response is supposed to be to the spike proteins contained in the CV-19 virus coating.

mRNA is a natural cellular component that is used in the production of protein compounds in the body. The shot injects a new mRNA segment into your body that takes over some of the production of protein, namely that which is found in the coating of the virus.

Your body's immune system recognizes the new protein as being a foreign agent, and creates an immune response to counter the effect of that protein.

Some call it Information Therapy that hacks the software of life, according to Moderna's [Mode RNA] chief scientist. You essentially become a GMO. Dr. Sherri Tenpenny mapped eight mechanisms that can result in death by a Covid jab

## A risk assessment

When considering risk, it is important to understand what is involved. The virus is not the disease. The disease is the body's response to the virus. The virus is the constant, but the body's response is the variable. A healthy body will fight off the virus. Some people's immune system might produce an over-reaction to the virus. Suppressing an over-reactive immune response can save a person's life.

There are three parts to a risk assessment;

- Probability of occurrence
  - There is a high probability that you will be exposed to the virus, but there is a lower possibility that you will have an immune response.
- Severity of outcome
  - Most people do not have a noticeable reaction to the virus.
  - Some people have had a severe immune response.
- Prevention / mitigation
  - There are effective treatments available if you have a severe immune response

## What has been the impact?

In the first month of use, there were more than 40,000 documented adverse reactions in the U.S., including thousands of cases of anaphylactic shock and serious neurological problems. Because only 10% of adverse effects are routinely reported, hundreds of thousands have likely been harmed. The FDA & CDC have not revealed to the public over 20 adverse effects, including death, related to Covid19 injections, which were discussed in an October 2020 meeting. 3,544 deaths from Covid19 injections are reported by

the National Vaccine Information Center as at 4/23/2021, and one-third of the deaths occurred within 48 hours.

### **What potential risks have been identified?**

The mRNA does not just do its job and then go away. It has been designed to live in the body, and will continue to do so until (if) it is rejected by the normal immune system. It may adapt over time, which is a normal process, but it remains a foreign mRNA segment. It may cause changes to DNA.

Adverse effects are inevitable.

There is convincing evidence that this experimental gene therapy may trigger an antibody-dependent enhancement reaction and increase the virus's ability to infect your cells.

British Medical Journal (BMJ) Associate Editor Peter Doshi has concluded that rather than the widely publicized 95% effective rate, these "vaccines" are, at best, 19% effective.

"Booster" shots are already being developed, supposedly to address Covid variants.

Unlike conventional vaccines, these spike proteins, along with "lipid nanoparticles" have the capacity to pass through the "blood-brain barrier" which provides special protection for these sensitive areas of the body.

These experimental vaccines produce many trillions of spike proteins in their recipients, these vaccinated individuals "can shed some of these (spike protein) particles to close contacts," causing disease in them.

The spike proteins are pathogenic ('disease causing') just like the full virus. Furthermore, these spike proteins bind more tightly than the fully intact virus and thus cases around the world of pericarditis, shingles, pneumonia, blood clots in the extremities and brain, Bell's Palsy, vaginal bleeding and miscarriages have been reported in persons who are near persons who have been vaccinated."

Children could develop long-term chronic autoimmune disease including neurological problems due to the fact that children have decades ahead of them and trillions of the spike proteins.

Thousands of reports involving vaginal bleeding, post-menopausal vaginal bleeding, and miscarriages following COVID-19 vaccination as well as anecdotal reports of similar adverse events among those in close contact with the vaccinated.

### **What to do now**

#### **Just say NO**

Your body, your choice.

The Biden administration is partnering with private companies to develop a vaccine passport system, claiming it's the only path to normalcy, but critics warn passports will steal people's liberty and data.

#### **Become informed about your legal rights**

You cannot be forced into receiving the shot. Understand how you can stand up against the pressure.

Prepare yourself with facts and a coherent message of resistance.
